PERSONAL PROFILE

I specialize in transforming complex business problems into scalable and maintainable technical solutions. With four years of experience, my career path is divided into two main strengths: modernizing critical corporate systems and developing high-impact SaaS products with agility.

What I bring to teams:

Modernization and Resilience: At Grupo Coppel, I orchestrated the migration of critical modules from a monolithic C++ system (Visual 2003) to modern microservices in Java (Spring Boot) and C#, ensuring operational continuity for thousands of users and optimizing savings and retirement systems.

Product Engineering (SaaS): Through my SinFila project, I built an end-to-end B2B/B2C platform for the restaurant industry using the Next.js, Tailwind, and Supabase ecosystems, solving challenges related to high concurrency and real-time data management.

Industrial ERP/CRM Solutions: At PVNUBE, I designed logic engines for heavy manufacturing, including N-depth Bill of Materials (BOM) structures and industrial documentation automation (Route Sheets, Workstations).

Technical Quality as the Standard: I implement Hexagonal Architecture and Test-Driven Development (TDD) not as an extra, but as the standard to guarantee robust and bug-free software in production.

SKILLS

WORK EXPERIENCE

Programmer | PVNube

September 2024 - May 2025 · 9 months

I led the development and architecture of critical modules for a comprehensive ERP/CRM system focused on the heavy manufacturing and metal assembly industry.

- N-Level Production Engineering:** Designed and programmed a logic engine for managing Bills of Materials (BOMs) with N levels of depth, enabling the configuration of complex metal part assemblies using tree data structures.
- Industrial Documentation Automation:** Automated the generation of essential technical documents, including Routing Sheets, Process Sheets, and Bills of Materials, optimizing time and workstation management on the production floor.
- CRM & Marketing Automation Integration:** Developed a robust integration with the Facebook Leads API, allowing for the automatic capture of leads and the creation of advertising campaigns directly from the CRM module for multiple companies.
- Data and Performance Optimization:** Implemented advanced SQL queries and backend logic in pure PHP to process bulk inventory movements and perform real-time production cost calculations.
- Digital Presence and SEO:** Increased the platform's organic visibility through technical SEO optimization and strategic content management via WordPress.

Programmer | Grupo Coppel

September 2022 - September 2024 · 2 years 1 month

I orchestrated the modernization of critical Human Resources and retirement systems, managing the transition from legacy architectures to cloud microservices for one of Mexico's largest retail companies.

- Cloud & Microservices (Colaborapp):** Developed high-performance microservices using Spring Boot, Docker, and Kubernetes for the 'Retirement Calculator' in the employee mobile app (Colaborapp). Optimized the extraction of financial data using complex stored procedures in SQL Server, exposing them through scalable RESTful APIs.
- Monolith Modernization:** Led the migration of more than 10 critical modules from a C++ monolith (Visual 2003) with 127 modules to new dynamic link libraries (DLLs) in C#/WinForms. Ensured the compatibility and stability of the personnel management system during the architectural transition.
- Full-Stack Development (Cocrea System):** Participated in the complete lifecycle of the Cocrea system using a Java (Hibernate), MongoDB, and Angular stack. Implemented the enterprise security layer by integrating Microsoft Entra ID (Azure) for identity management.
- Report Automation:** Eliminated the reliance on manual Excel processes by developing advanced stored procedures in SQL Server, integrating automated employee savings reports directly into the new system modules.
- Quality and Testing:** Reduced the incidence of errors in production by designing and executing automated test suites for APIs using Postman.

Backend Developer | SIR Soluciones Ambientales

January 2024 - August 2024 · 8 months

I designed and deployed a centralized architecture for the operational and logistical management of a leading company with 20 years in the waste collection sector.

- Unified Architecture:** Orchestrated a comprehensive ecosystem comprised of three platforms (Backoffice, Frontoffice, and Mobile) using a unified backend in Python (Flask) and PostgreSQL.
- Real-Time Logistics Management:** Developed the SIR system, integrating critical real-time fleet monitoring and dynamic route planning functionalities to optimize operational efficiency.
- Legal Compliance and Automation:** Automated the generation of Waybills and the detailed tracking of collection materials, ensuring full traceability and compliance with current regulations.
- Quality Control and Cloud Storage:** Implemented an audit workflow using preventive and corrective checklists, integrating a file system in AWS S3 to document the physical condition of the trucks with photographic evidence before and after each route.
- Business Intelligence:** Designed custom dashboards for the visualization of operational KPIs, enabling data-driven decision-making for resource and staff allocation.

IT Support Technician | BanCoppel

July 2022 - September 2022 · 3 months

I performed technical support operations, ensuring the availability of banking services at branches by resolving incidents in real time.

- High-Level Support (Banking Hardware):** Provided specialized technical support for banking peripherals, resolving complex hardware and software integration issues.
- Incident Management:** Managed virtual support tickets under strict service level agreements, optimizing response times for software errors and device configuration.
- Software Optimization:** Performed preventative and corrective diagnostics, including driver reinstallation and system error debugging, to maximize the stability of the technological tools used by bank staff.

Frontend Developer | Tessiuto

January 2022 - July 2022 · 7 months

Specialized in building high-impact features for a textile industry ERP, focusing on operational stability and automated inventory management.

- Catalog & Inventory Optimization:** Developed comprehensive Fabric and Color catalogs, allowing for precise material classification based on specific product applications.
- Commercial Workflow Automation:** Engineered a remote price authorization module to facilitate real-time business validations and secure commercial price controls.
- Logistics Efficiency:** Automated dynamic label printing systems for warehouse operations, integrating production data to streamline shipping and storage workflows.
- Full-Stack Integration:** Built scalable and responsive user interfaces using Angular Material, Bootstrap, and jQuery, ensuring seamless connection with RESTful backend services.

PROJECTS

Sinfila - Backoffice

Preview

Next.js Backoffice Platform - An application to manage branches, reservations, and customers in restaurants.

Sinfila - Customer

Preview

Next.js B2B Reservation Platform - An application to create reservations or join virtual queues at restaurants.
